

Brownstone's Digital Surveillance Solutions

Brownstone Technology Solutions

*"Your Partner in Surveillance Systems.
A Partnership You Can Trust"*

MSGV Series Surveillance Systems

- Real-Time Recording and Display
- 16 Channel Audio Recording and Playback
- Video Compression Technology: MPEG-4, ASP, H264
- Full D1 Resolution
- User Friendly Interface
- Motion -Detection Recording, CD/DVD Backup, Extended Storage Capability & A RAID-Controlled Platform
- POS Integration

Brownstone's MSGV series provides active protection

Monitor

Detect

Alert

Brownstone Technology Solutions

Brownstone's MSGV-Series is a PC based multichannel video surveillance system that utilizes the most advanced digital video compression technologies to bring you the highest picture quality and video performance. The MSGV-Series product range starts from our entry level MSGV-250 to flagship MSGV-1480. Up to 16 cameras can be connected and viewed live on a local monitor screen or over a network or internet connection. Video can be recorded based on specifiable schedules or motion detection. You can store video clips on a hard drive or any optical storage device by using Brownstone's Backup System.

While many people perceive video surveillance to be a passive system which just records activities for review at a later time, the Brownstone MSGV Series provides active protection through a series of detailed steps: Monitor, Detect and Alert. The many benefits of the Brownstone's MSGV Series include:

Monitor

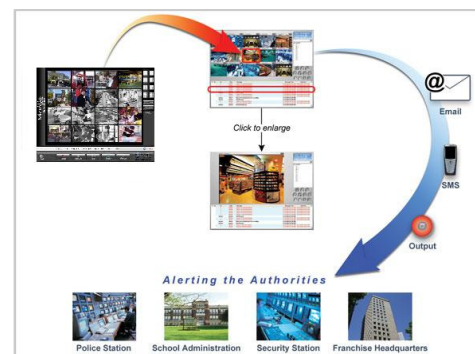

Brownstone's video surveillance systems are used to monitor activity through the use of cameras in conjunction with a digital video recorder that records all activity. Monitoring may be done on a continuous basis, during preset time periods or when the camera is activated by a predetermined event such as movement or a door opening. Some of the features and benefits for monitor viewing include:

- Dual display operation for live monitoring and view log playback on two monitors
- Object counting allows you to count the number of objects that pass between pre-defined regions
- Object tracking and zooming by PTZ domes
- Screen pop-ups on motion alarm activation
- Keep days: keeps video files for set number of days
- Digital watermark on AVI files for video authentication
- Unattended and missing object detection
- Supports up to 1,000 accounts for logins and passwords

Detect

As the Brownstone's MSGV series video surveillance system monitors activity it can be programmed to detect various activities. Some of the most common activities that can be detected include:

- Movement
- The removal of an object
- The addition of an object
- The crossing of a predetermined point
- The opening of doors or windows
- The setting off of a burglar alarm
- The input of a transaction into a point-of-sale system

Brownstone Technology Solutions

Alert

When certain activities are detected, an alert can then be transmitted to other authorized users of the system. Alerts can be transmitted through the following:

- E-mail notifications with attached video images on motion and alarm activation
- E-mail or telephone notification on video lost or I/O error
- Directs PTZ dome to a preset location on motion and alarm activation

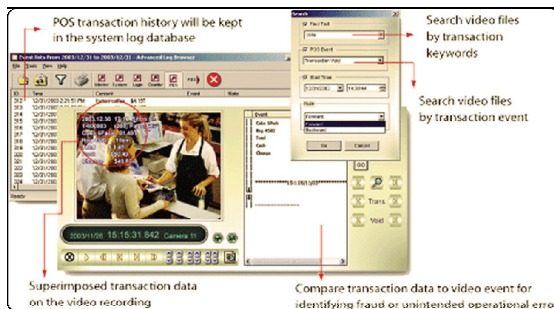

Video surveillance systems can offer security benefits to the following industries:

- Hospitality
- Retail
- Industrial
- Hotel/Motel
- Transportation

Video surveillance systems can be customized to offer the following benefits:

Point-Of-Sale Integration

Brownstone's MSGV video surveillance may be integrated with point-of-sale systems in order to provide a record of all transactions as they occur and provides a number of video monitoring solutions with visual contextual awareness that can help business owners protect their business as well as reduce shrinkage. As the video is recorded text is embedded into the video which documents the

transaction in real time. In addition, certain types of transactions can be identified, so that when they occur an alert is sent to the proper person. For example, any time a no-sale transaction occurs an alert could be sent via text message to a manager.

Inventory Control

Brownstone's MSGV video surveillance can be used as a very effective tool in inventory control. Inventory shrinkage is a serious concern for many businesses, and video surveillance can be used to monitor locations where inventory is stored and provided alerts when certain types of activities occur. For example, a text message could be sent to the authorized manager anytime someone enters a predetermined room where expensive items are stored.

Loss Prevention

Video surveillance systems are a common component of loss prevention programs. The MSGV video surveillance system is monitored either live or remotely in order to identify suspicious activity. When suspicious activity is detected, appropriate action is taken and the surveillance system provides a video record of the activity and all related actions.

Webcam

The surveillance cameras may be monitored from anywhere where there is internet access. This allows for business owners and managers to maintain better control over all activities within their business location and better monitor day-to-day activities. Webcam offers many features and benefits which include:

- Single and multi-view
- User defined bandwidth control
- Two-way audio communication
- Remote access to video and audio files
- Video archive by Date/Time/Cameras
- Supports mobile streaming
- Support widescreen resolution

Call us today to find out why hundreds of people have trusted Brownstone Technology Solutions with their surveillance needs. We will provide you with a complimentary site survey to help you choose the system that best fits your needs.

Do you have a specific surveillance need that you need more information about?

Call us today at 866.535.0022 and speak to one of our experienced technicians regarding your inquiry.
